

Smartscreen Motorized Clear Vinyl

Smartscreen Motorized Clear Vinyl Systems are manufactured with 20 gauge, flame rated press polished clear vinyl sheets and are formulated to the highest standards for minimal shrinkage and crisp clarity. Using the best in class vinyl material to maximize performance, durability, fit and finish with a material that carries an industry leading less than 1% shrinkage rate compared to other vinyl with shrinkage rates at 4%-5%.

The minimum solid vinyl borders are 8" on sides and 12" at the top and bottom which will help absorb the shrinking and expansion of the material preventing performance issues. For larger application in colder climates it may be advisable to increase border sizes, especially the sides.

Care and Maintenance

Clear Vinyl does expand and contract based on changing weather conditions so please follow these steps to ensure many years of trouble free use:

- Keep the vinyl screens rolled up when not being used
- In cooler weather, ensure the area where the units are being installed has a heat source and that source is turned on to allow the area to warm up as much as possible prior to operating the screens
- Ensure the tracks are thoroughly lubricated with a dry silicone spray
- To clean the clear vinyl wash the Vinyl with a mild detergent, warm water and a microfiber cloth
- To keep your clear vinyl looking as good as new, use a coated clear vinyl specific cleaning and moisturizing product (Imar, 303) and a clean microfiber cloth on the clear vinyl.
 - o Use of cleaning, waxing, polishing, or any cleaning product not specifically made for coated clear vinyl can leave the vinyl looking dull or stained. Do not use a water repelling products on the screens. Do not handle vinyl with sunscreen on your hands.
